The TNS is **dynamic** – constantly adjusted to meet the changing needs

Modifications to the treatment of the Discovery (Source) Group

2019-12-01 - Dr. Ofer Yaron (WIS)

In order to adapt the TNS for both the present and future needs, and in particular to the activity of transient brokers as significant sources that report discoveries of transients that are observed and publicly released by the observing surveys/facilities, we will deploy next week - on Monday, Dec 2nd, 2019 - small adjustments to the handling of the "discovery group/s", by introducing instead two distinct group identifications: the Reporting group and the Discovery Data Source group.

The changes affect the AT Report JSON/TSV formats (and clearly the AT Report Form), the search page, the object page, the discovery certificate and the statistics pages.

Please refer to [AstroNote 2019-136](#) for additional clarifications on the essence of the revised treatments.

As mentioned, even if you did not revise your JSONs to the new format, your AT reports should not fail until Jan 31st, 2020.

However, if sending AT Reports via TSV, you should have the correct revised columns in place (reporting_group_id, discovery_data_source_id - Instead of the single groupid).

Bibcode: [2019TNSAN.136....1Y](#)

Modifications to the TNS treatment of the "Discovery Group" - to be deployed on Dec 2nd, 2019.

Authors: Ofer Yaron, Avishay Gal-Yam, Avner Sass (Weizmann)

Keywords: [Surveys](#), [Transient](#), [Astronomical Databases](#)

Abstract: In order to adapt the TNS for both the present and future needs, and in particular to the activity of transient brokers as significant sources that report discoveries of transients that are observed and publicly released by the observing surveys/facilities, we will deploy next week - on Monday, Dec 2nd, 2019 - small adjustments to the handling of the "discovery group/s", by introducing instead two distinct group identifications: the Reporting group and the Discovery Data Source group. Bot owners should apply these changes in the scripts for the Bulk AT Reports, whether via JSON or TSV submissions, as described below.

The Transient Name Server - overview

- In operation since **Jan 1st 2016**. The official IAU mechanism for reporting new astronomical (extra galactic) transients and specifically for official name designation. (Set up by the IAU in order to provide a modern, automatic mechanism to archive and distribute alerts about transients, replacing the manual defunct CBAT system.)
- [As of Apr 2021] holds **>70k** reported transient candidates (“ATs”), **~7k (10%)** classified SNe (including a full catalog of all pre-2016 SNe); **>1k** registered users, **>100** groups.
- The basic TNS object is an Astronomical Transient (**AT**) with a unique identifier of the form AT YYYYx (x=A..Z, aa..zz, aaa..zzz,...). The prefix “AT” can be later changed to indicate a classification (e.g., “SN”) but the unique identifier is always kept.
- Most reports are submitted automatically by “bots” of the major surveys & brokers (PS1, ZTF, Gaia, ATLAS...), but it is also possible to submit reports interactively using forms. Discovery reports are called **AT-reps** whereas classification reports (supported by a spectrum, for the “normal” transients) are called **Class-reps**.
- The system naturally handles multiple reports on the same event (e.g., discoveries of the same object by different surveys) and keeps a (fully searchable) record of “internal names” that are associated with each AT-rep.
- The system supports a service for short astronomical announcements (**AstroNotes**) which is a superior version of the ATEL system (e.g., searchable; hyperlinked to specific objects).
- All reports and AstroNotes are indexed by the **ADS** and are citable.

The Transient Name Server - overview

- Currently all alerts/notifications from the TNS (discoveries/classifications/AstroNotes) are distributed via emails to the registered users, according to their defined preferences. (Additional staging/alerting mechanisms (e.g. Kafka streams) may be added.)
- Some data can be reported as **proprietary** for a certain period of time; e.g. securing a name designation without official release of the details yet, or not exposing a classification spectrum.
- Groups, Bots and memberships are all **self-managed** (by the users/group-owners), thus enabling flexible handling of access permissions, controlling the discovery credits etc.
- The system has recently been migrated to the **AWS cloud**, increasing its H/A capacity, and is designed to ingest the LSST streams and to be online ~99.999% of the time.
- Recently the **FRB community** joined the TNS.
 - An additional subsystem was developed for handling the specific requirements of FRBs – including a separate naming engine (FRB YYYYMMDDx), a separate report form (for the specific FRB properties), and enabling specification of area localizations ("**area transients**").
 - The system was tailored to meet the wishes of the FRB community.

Daily staging of all TNS public objects as CSV text files

2021-03-15 - Dr. Ofer Yaron (WIS)

We are glad to announce a new feature we have deployed, to enable easier and quicker mass download of information about TNS public objects.

Staging the CSV files will fulfil requests by TNS users, as well as encourage performing time-consuming operations locally by users, reducing the load on t

For example, if you need to cross-match entire catalogs or long object lists, we request that this would be done locally, against the csv (or a locally manage
Calling the APIs for a limited number of objects is clearly fine, but we ask that our users apply appropriate caution and sensibility when using the TNS reso

Every day after UT midnight, two CSV files are created and are accessible for download under: https://www.wis-tns.org/system/files/tns_public_objects/

1. **tns_public_objects.csv.zip** - holds the entire catalog of TNS public objects (AT/SN/FRB/... ~70,000 currently). This file is overwritten daily.
The date and time when the list of objects was created is specified in the first line; e.g. "2021-03-15 00:00:00"

2. **tns_public_objects_YYYYMMDD.csv.zip** - holds only those entries (objects) that were either added or modified during the specified day.
So, e.g. during Mar 15, 2021 it is possible to download this latest CSV for the previous day: `tns_public_objects_20210314.csv.zip`
The first line in the CSV will contain the exact duration covering the entries in the file; e.g. for the above example: "2021-03-14 00:00:00 - 23:59:59"

The separate daily files remain in place for 1 month backwards.

TNS - Getting started

- General
- Registration, reporting methods
- Email notifications (*Immediate/Daily digests*)
- ADS indexing
- Report forms (*Discovery/Classification*)
- APIs
 - Bulk reports
 - Change prop. period
 - Search/Get Objects
- Groups, proprietary period
- Discoverer/Classifier
- Search page
- Statistics page
- LIGO GW Events
- Quick query links
- Daily CSV staging
- AstroNotes
- Funding and Support

APIs, Bulk downloads

- A Sandbox environment exists for experimentation with the APIs (both for submission and retrieval of info)

All API development must be performed against the sandbox!!!

<https://sandbox.wis-tns.org>

<https://sandbox.wis-tns.org/api>

- APIs are in place for:
 - the submission of Discovery (AT) and Classification reports.
 - Searching of objects (by coords, names – IAU/internal)
 - Retrieving object details
- CSV/TSV downloads are available from the Search page (also in a scriptable way)

e.g. https://www.wis-tns.org/search?&&classified_sne=1&date_start%5Bdate%5D=2021-01-01&format=csv&num_page=100&page=0 ←[0..N]

- A CSV of all public objects (as well as daily “delta” lists) are available for download, in order to allow for easy local managing of the TNS data and to perform “heavy” operations locally (such as cross-matching entire catalogs or long object lists)

https://www.wis-tns.org/system/files/tns_public_objects/tns_public_objects.csv.zip

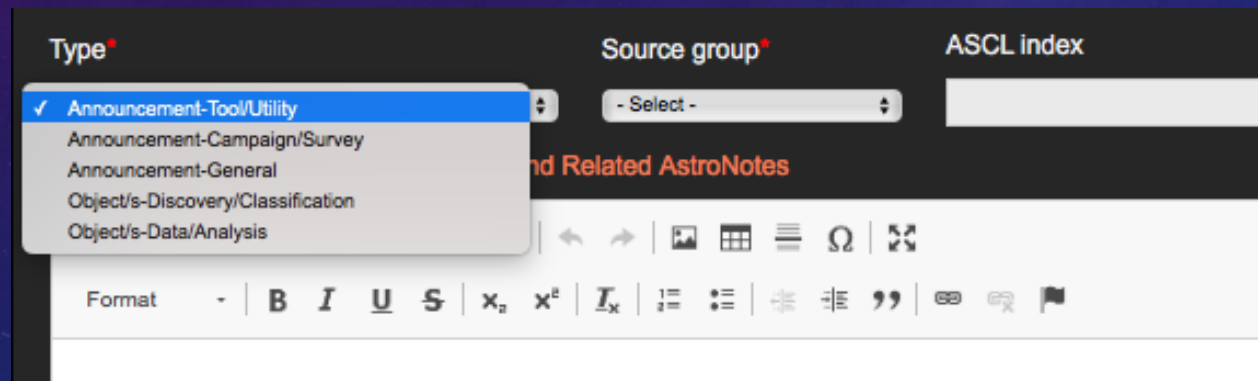

Or using curl (with api_key) for a daily csv:

```
curl -X POST -d 'api_key=YOUR-API-KEY' https://www.wis-tns.org/system/files/tns_public_objects/tns_public_objects_20210404.csv.zip > tns_public_objects_20210314.csv.zip
```

AstroNotes!!!

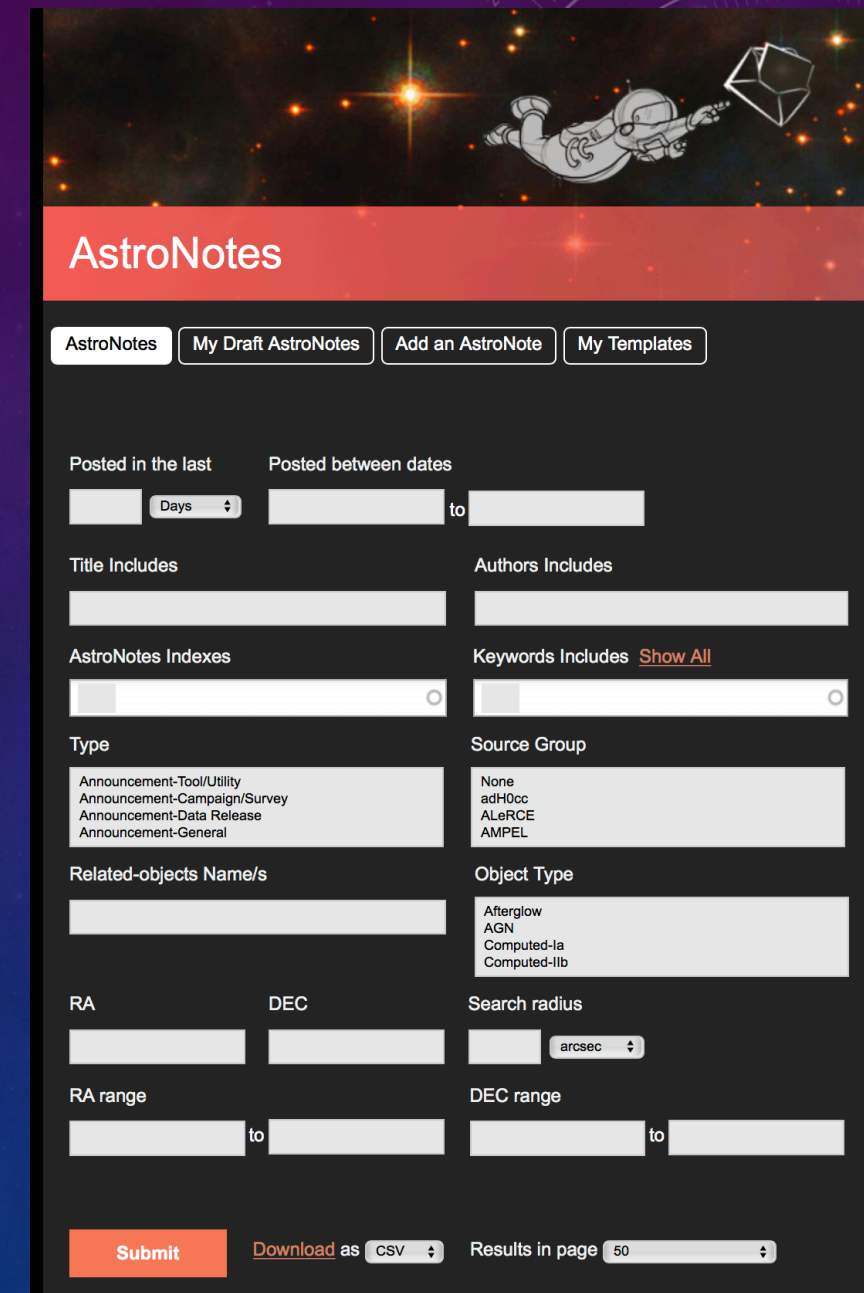

- A sub-system within the TNS (so no need to register to an additional service for creating and receiving these notifications).
- Enabling the distribution of notifications in a very flexible (yet accurate) way, **directly coupled** to the related objects, **searchable and citable**.
- Can create either an object-related (discovery, classification, analysis) or an “announcement” notification, **without any restrictions, limitations or penalties...**

The screenshot shows the 'Type' dropdown menu open, with the following options:

- ✓ Announcement-Tool/Utility
- Announcement-Campaign/Survey
- Announcement-General
- Object/s-Discovery/Classification
- Object/s-Data/Analysis

Other visible fields include 'Source group' (set to '- Select -') and 'ASCL index'.

The screenshot shows the AstroNotes interface with the following sections:

AstroNotes!!!

- A “sub-system” within the TNS.
- Enabling the distribution of notifications in a very flexible way, directly coupled to the related objects, searchable and citable.
- Easy managing and use of **Templates**, for quicker writing of a new AstroNote.
- Easy sharing of **Drafts** with the colleagues; allowing definition of several editors to continue editing the draft until submission.

The screenshot displays the AstroNotes web interface. At the top, there's a navigation bar with buttons for 'AstroNotes', 'My Draft AstroNotes', 'Add an AstroNote', and 'My Templates'. Below this, a 'Save as draft' button is visible. A 'Use template' section is highlighted with an orange circle, showing a dropdown menu with the selected template: 'ATLAS20XXX (AT2020YYY): discovery of a candidate supernova in NGC XXXX (XX Mpc) [ATLAS]'. Below the dropdown, the 'Template Instructions' are listed, providing detailed guidance on how to fill out the template, including instructions on title formatting, paragraph structure, and the use of the 'Generate ATel' button. At the bottom, the 'Additional AstroNote editors' section is also highlighted with an orange circle, showing three input fields for adding collaborators. The main form area includes fields for 'Title' (pre-filled with the template title), 'Authors' (pre-filled with a list of names), and a large text area for the note content.

AstroNotes!!!

- A “sub-system” within the TNS.
- Enabling the distribution of notifications in a very flexible way, directly coupled to the related objects, searchable and citable.
- Easy managing and use of Templates, for quicker writing of a new AstroNote.
- Easy sharing of Drafts with the colleagues; allowing definition of several editors to continue editing the draft until submission.
- Many **Search options**, including by object names, types and coords.

Clarifications / to summarize

- The TNS manages discovery & classification information (data), NOT extended LCs, spectral sequences etc... For this, data repositories such as WISeREP are relevant.
- Initiated mainly for SN candidates, the TNS also handles other extra-galactic transients, including novae (CVs), AGN flares, TDEs, Kilonovae... BUT NOT variable stars, asteroids or other such galactic/local variable/moving sources.

PLEASE DO NOT submit varstars/moving objects but only secure extra-galactic transient candidates!!!

- “Area Transients” are also officially joining the TNS: FRBs, and soon also GRBs, GW events.
(In future more sophisticated cross-matching and association capabilities should be implemented – both on the TNS, and hopefully also by the additional utilities being developed.)
- Classifications must be supported by a spectrum (not relevant for the area transients), and currently the TNS only switches the **prefixes** from **AT** to **SN**. (TDEs, Kilonovae... remain AT until an official decision will be made.)
- API sample codes are available for download on the help page.
- For any questions/feedback/suggestions related to the use of the TNS, its APIs, AstroNotes, please do not hesitate to contact us: www.wis-tns.org/content/contact-us (or me in person)

Current LIGO pages on the TNS – a clarification

- During O1-O3 observing runs, we ingested to the TNS the reported LIGO events and based on the localization maps (HEALPix) provided to the community maps and tables of the known transients (ATs) on the TNS discovered within half a year BEFORE the GW event and the discovered transients within the localizations during the 2 weeks AFTER the event.
- The plan is to continue doing so for the future LVK runs. Any ideas and recommendations are clearly welcome.
